Cooling & Heating

<PM NO: 0857E>

SAFETY DURING REPAIR WORK

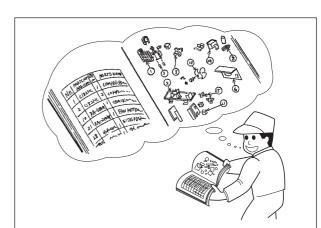

1. In order to disassemble and repair the unit in question, be sure to disconnect the power cord plug from the power outlet before starting the work.

2. If it is necessary to replace any parts, they should be replaced with respective genuine parts for the unit, and the replacement must be effected in correct manner according to the instructions in the Service Manual of the unit.

If the contacts of electrical parts are defective, replace the electrical parts without trying to repair them.

- 3. After completion of repairs, the initial state should be restored.
- 4. Lead wires should be connected and laid as in the initial state.
- 5. Modification of the unit by the user himself should absolutely be prohibited.

- 6. Tools and measuring instruments for use in repairs or inspection should be accurately calibrated in advance.
- 7. In installing the unit having been repaired, be careful to prevent the occurrence of any accident such as electrical shock, leak of current, or bodily injury due to the drop of any part.
- 8. To check the insulation of the unit, measure the insulation resistance between the power cord plug and grounding terminal of the unit. The insulation resistance should be $1M\Omega$ or more as measured by a 500V DC megger.
- The initial location of installation such as window, floor or the other should be checked for being and safe enough to support the repaired unit again.
 If it is found not so strong and safe, the unit should be installed at the initial location after reinforced or at

a new location.

- 10. Any inflammable object must not be placed about the location of installation.
- 11. Check the grounding to see whether it is proper or not, and if it is found improper, connect the grounding terminal to the earth.

WORKING STANDARDS FOR PREVENTING BREAKAGE OF SEMICONDUCTORS

Scope

The standards provide for items to be generally observed in carrying and handling semiconductors in relative manufacturers during maintenance and handling thereof. (They apply the same to handling of abnormal goods such as rejected goods being returned).

2. Object parts

- (1) Micro computer
- (2) Integrated circuits (I.C.)
- (3) Field-effective transistor (F.E.T.)
- (4) P.C. boards or the like to which the parts mentioned in (1) and (2) of this paragraph are equipped.

3. Items to be observed in handling

(1) Use a conductive container for carrying and storing of parts. (Even rejected goods should be handled in the same way).

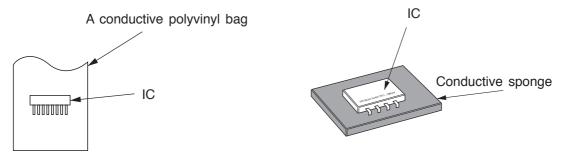

Fig. 1. Conductive container

- (2) When any part is handled uncovered (in counting, packing and the like), the handling person must always use himself as a body earth. (Make yourself a body earth by passing $1M\Omega$ earth resistance through a ring or bracelet).
- (3) Be careful not to touch the parts with your clothing when you hold a part even if a body earth is being taken.
- (4) Be sure to place a part on a metal plate with grounding.
- (5) Be careful not to fail to turn off power when you repair the printed circuit board. At the same time, try to repair the printed circuit board on a grounded metal plate.

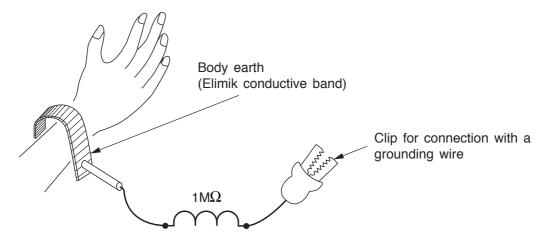

Fig. 2. Body Earth

(6) Use a three wire type soldering iron including a grounding wire.

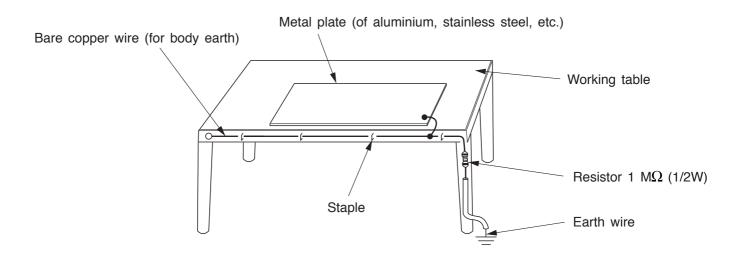

Fig. 3. Grounding of the working table

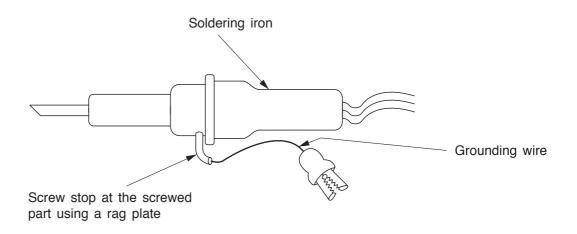

Fig. 4. Grounding a solder iron

Use a high insulation mode (100V, $10M\Omega$ or higher) when ordinary iron is to be used.

(7) In checking circuits for maintenance, inspection or some others, be careful not to have the test probes of the measuring instrument short circuit a load circuit or the like.

A CAUTION

- 1. In quiet or stop operation, slight flowing noise of refrigerant in the refrigerating cycle is heard occasionally, but this noise is not abnormal for the operation.
- 2. When it thunders nearby, it is recommend to stop the operation and to disconnect the power cord plug from the power outlet for safety.
- 3. In the event of power failure, the air conditioner will restart automatically in the previously selected mode once the power is restored. In the event of power failure during TIMER operation, the air conditioner will not start automatically. Re-press ON/OFF button after 3 minutes from when the unit off or power recovery.
- 4. If the room air conditioner is stopped by adjusting thermostat, or miss operation, and re-start in a moment, there is occasion that the cooling and heating operation does not start for 3 minutes, it is not abnormal and this is the result of the operation of IC delay circuit. This IC delay circuit ensures that there is no danger of blowing fuse or damaging parts even if operation is restarted accidentally.
- 5. This room air conditioner should not be used at the cooling operation when the outside temperature is below -18°C (-0.4°F).
- 6. This room air conditioner (the reverse cycle) should not be used when the outside temperature is below -20.55°C (-5°F).

 If the reverse cycle is used under this condition, the outside heat exchanger is frosted and efficiency falls.
- 7. When the outside heat exchanger is frosted, the frost is melted by operating the hot gas system, it is not trouble that at this time fan stops and the vapour may rise from the outside heat exchanger.

SPECIFICATIONS

Figure showing the Installation of Indoor Unit

MODEL RAC-DJ12WHAA

OUTDOOR UNIT

A CAUTION

• When heating operation, drain or defrosted water flows out from outdoor unit. Don't close drain outlet portion in chilly area so as not to freeze these.

MODEL NAME AND DIMENSIONS

| MODEL | WIDTH in (mm) | HEIGHT in (mm) | DEPTH in (mm) |
|--------------|-----------------|-----------------|----------------|
| RAC-DJ12WHAA | 29-17/32" (750) | 22-14/32" (570) | 11-1/32" (280) |

MULTI-AIR CONDITIONER

Several indoor units can be connected to one outdoor unit. You can operate only one unit or several units according to your needs.

Combination of Operations:

When operation mode is selected:

• You cannot operate the indoor units in the following combinations.

| One unit | Other unit |
|----------|---------------|
| | Cooling |
| Heating | Dehumidifying |
| | Fan |

- The indoor unit which is turned on first continues to operate. Other indoor units which are turned on later go into stanby mode and the operation lamp lights.
- To operate the indoor units turned on later, set the operation mode as same as the indoor unit turned on first.

During automatic operation:

 When heating operation is automatically selected for the first indoor unit, the next indoor unit will then start to heat. Also, if cooling or dehumidifying is automatically selected for the first indoor unit, the next indoor unit will also start to cool or dehumidify.

Adjusting the Number of Indoor Units:

Decrease the number of indoor units to be operated especially when it is very hot or cold or when you want to reach the present temperature quickly.

Stopped Indoor Units:

When an indoor unit is operated in the cooling, heating or dehumidifying mode in the room, the sound of refrigerant flow may be heard from a stopped indoor unit or a stopped indoor unit may become warm. This is because the indoor unit returns refrigerant to the outdoor unit to be ready for operation.

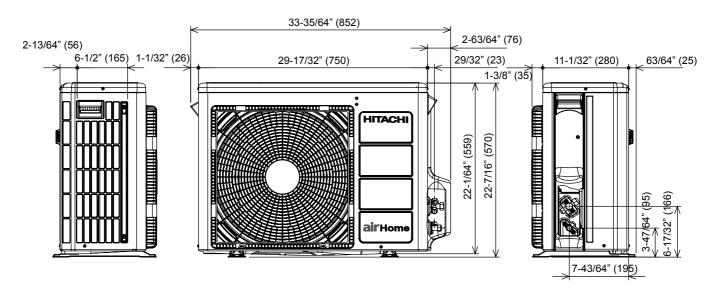

OPERATING RANGE

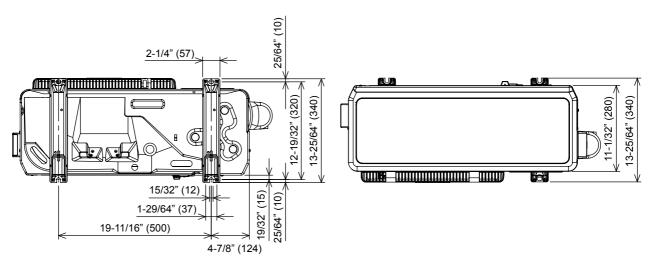

| Operation mo | ode | Coc | oling | Heating | | | |
|---------------------|----------|----------------|----------------|-----------------|---------------|--|--|
| | | Minimum | Maximum | Minimum | Maximum | | |
| Indoor temperature | Dry bulb | 70°F (21°C) | 90°F (32°C) | 68°F (20°C) | 81°F (27°C) | | |
| | Wet bulb | 59°F (15°C) | 73°F (23°C) | ı | _ | | |
| Outdoor temperature | Dry bulb | -0.4°F (-18°C) | 114.8°F (46°C) | -5°F (-20.55°C) | 75.2°F (24°C) | | |
| | Wet bulb | _ | _ | _ | _ | | |

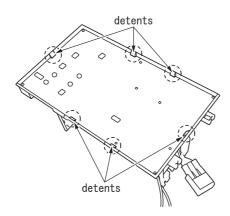

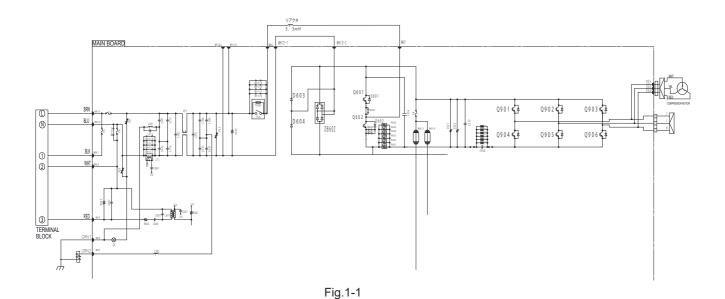

Fig.15

DESCRIPTION OF MAIN CIRCUIT OPERATION

MODEL: RAC-DJ12WHAA

1. Power Circuit.

* This circuit rectifies the AC voltage 230V applied between terminal L and N and creates a DC voltage.

The voltage become 320-360V when the compressor is operated.

- * Importance components.
- (1) Inverter circuit for compressor (Q901 to Q906). The elements constitute the inverter part.
- (2) Diode stack (DB602).

 The diode stack rectify AC Voltage 230V applied between the Terminal board L and N to DC Voltage.
- (3) Smoothing capacitor (C021 to C022, 500uF,450V).
- (4) IGBT for the power factor improvement (Q601).
- (5) Surge absorber, varistor 1 and 2. The surge absorber and varistor absorb exogenous surge, including inductive lightning.
- (6) Noise filter (C001,C002,C006,C007,C013,C014, NF Coil). The noise filter absord electrical noise generated when the compressor operates and when exogenous noiseis mixed through the power line. In order to protect electronic parts.

<Reference>

When the inverter circuits for compressor (Q901 to Q906) have a failure or improper connection, the compressor may stop immediately after its starts, due to "Abnormal low speed", "Switch failure", "IP Stop", etc.

<Reference>

When the diode stack (DB602) has failure, DC voltage can not be generated, completely disabling the operation of the compressor. Also note that 2A fuse may have blown.

<Reference>

X The smoothing capacitor smoothes (average) voltage rectifier by the diode bridge.

<Reference>

 It will improve efficiency during compressor load become heavy when current flow thru the chopper period of Q601.

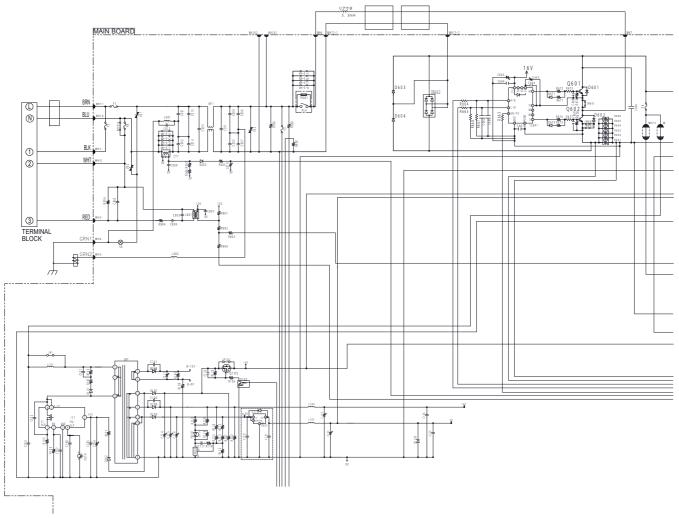

<Reference>

Be sure to ground the surge absorber and varistor. without grounding, the surge absorber and varistor do not operate normally.

<Reference>

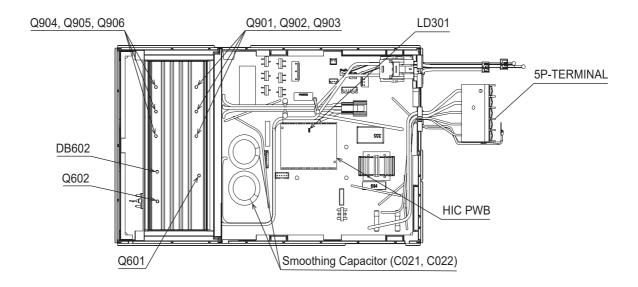

Without grounding, the noise filter on the left do not operated normally.

2. Power Circuit (Low Voltage)

- Fiq. 2-1
- The 230V VAC voltage is rectified to DC voltage (B-12V, 16V, 12V, 5V) pass through switching control IC (IC1), Switching transformer.
 - (1) B-12 Power supply for electrical expansion valve.
 - (2) 16V Power supply for driver circuit of compressor and fan motor, IGBT action.
 - (3) 12V Power supply for 4-way valve relay, power relay, motor current amplification.
 - (4) 5V Power supply for microcomputer, peripheral circuit.

MODEL RAC-DJ12WHAA

** Because high voltage flows, be careful about electric shock. Also, be careful about short-circuit accidents by improper connection of measuring instruments, which can damage the board.

3. Power Supply Circuit for Board

The voltage specification of the power supply circuit are as follow.

<Checking points>

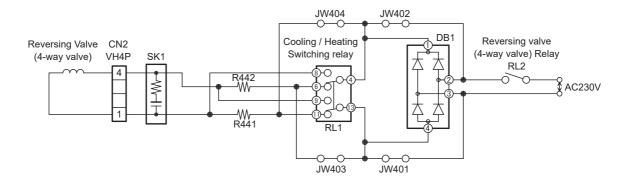

| Output Name | Voltage Specifications Value | Main Load | Measurement Position | Example of failure mode for each output failure (Reference) |
|-----------------|------------------------------------|---|---|---|
| 5V Output | 5 ±0.4 V | Microcomputer Thermistor | Tester(+)terminal:J96(5V indication) Tester(-)terminal:J138(0V indication) | The troubleshooting lamp LD301 does not indicate and the outdoor unit does not operate. |
| 12V Output | 12 ±1 V | Microcomputer IC2,3 and 4 Relay Circuit | Tester(+)terminal:J139(12V indication) Tester(-)terminal:J138(0V indication) | The troubleshooting lamp LD301 does not indicate and the outdoor unit does not operate. |
| 16V Output | 15.5 ±1.5 V | Compressor Inverter Ciruit Fan Inverter Circuit | Tester(+)terminal:J111(16V indication) Tester(-)terminal:J138(0V indication) | The troubleshooting lamp LD301 blinks 3,4 or 12 times and the outdoor unit stops. |
| B-12V Output | 12 ⁺³ V | Expansion Valve | Tester(+)terminal:J133(B-12V indication) Tester(-)terminal:J130(B-0V indication) | The troubleshooting lamp LD301 blinks 5 times and the outdoor unit stops. |

^{*} When checking each voltage, if the voltage specifications above are met, the power supply circuit for the board is functioning normally.

4. Reversing valve control circuit

This model reversing valve control used to control the relay ON/OFF of the reversing valve, and also control the coil of the reversing valve ON/OFF. The relay ON/OFF has different operation mode. You can see each operation mode as flows. If the reversing valve not connected or all the condition not the same as follow, it may be something wrong with the reversing valve circuit.

| Operation | Point mode. | Micon pin 9 - 0V | HIC pin 35 - 0V | CN2① - CN2④ |
|-----------|---------------|------------------|-----------------|-------------|
| Cooling | Usual cooling | Hi | 0V | AC230V |
| Heating | Usual heating | Lo | 12V | 0V |
| Heating 1 | Defrost | Hi | 0V | AC230V |

| TYPE | RL1 | DB1 | JW401 - JW404 | R441 - R442 | SK1 |
|------------------|-----|-----|---------------|-------------|-----|
| Electrified type | NO | NO | YES | JUMPER | YES |

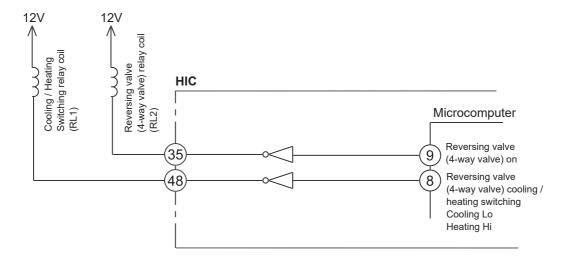

Fig. 4-1

5. Temperature Detection Circuit

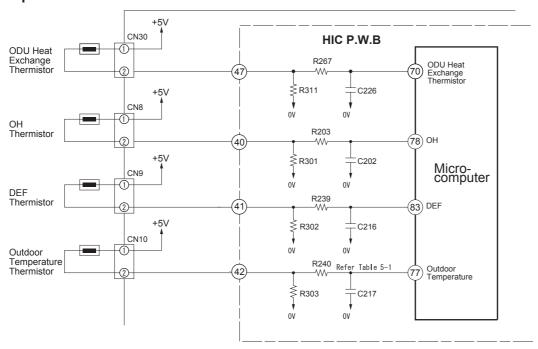

Fig. 5-1

- OH thermistor circuit detect the temperature at the surface of compressor head, DEF thermistor circuit detect the defrosting operation temperature.
- A thermistor is a negative resistor element which has characteristics that the higher (lower) the temperature, the lower (higher) ther resistance.
- When the compressor is heated, the resistance of the OH thermistor becomes low and +5V is devided by OH thermistor and R301 and the voltage at pin 78 of microcomputer.
- Compare the voltage at microcomputer pin 78 and setting value stored inside. If the value exceed the set value, microcomputer will judge that the compressor is overheated and stop the operation.
- When frost is formed on the outdoor heat exchanger, the temperature at the exchanger drops abruptly.

 Therefore the resistance of the DEF thermistor becomes high and the voltage at pin 83 of microcomputer drops.

 If this voltage becomed lower than the set value stored inside, microcomputer will enter the defrost control.
- During defrost operation, the microcomputer will transfer the defrosting condition command to indoor unit via SD0 pin of interface of IF transmission output.
- The microcomputer read the outdoor temperature by Outside Air thermistor and transfer it to the indoor unit, thus controlling the compressor rotation speed according to the set value in the EEPROM of indoor unit and switching the operation mode (outdoor fan on/off etc.) to DRY mode.

Below table show the typical values of outdoor temperature in relation to the voltage.

| Outside Air Temperature (°C) | 14°F | 32°F | 50°F | 68°F | 30°F | 104°F |
|----------------------------------|---------|-------|--------|--------|--------|--------|
| | (-10°C) | (0°C) | (10°C) | (20°C) | (86°C) | (40°C) |
| Voltage at both side of R303 (V) | 1.19 | 1.69 | 2.23 | 2.75 | 3.22 | 3.62 |

Table 5-1

• The ODU heat exchanger thermistor circuit measure the heat echanger intermediate temperature of the outdoor unit, and microcomputer estimate the pressure of compressor according to the temperature data. When the pressure reach the internal set value of the microcomputer, the microcomputer will adjust the speed of the compressor to protect the pressure of compressor.

<Reference>

When the thermistor is open, open condition or disconnect, microcomputer pin 70 77 78 83 are approx. 0V; When thermistor is shorted, they are approx. 5V and LD301 will blink 7 times. However, an error is detected when only the OH thermistor is shorted and will enter blinking mode after 12 minutes start the compressor operation.

6. Electric expansion valve circuit

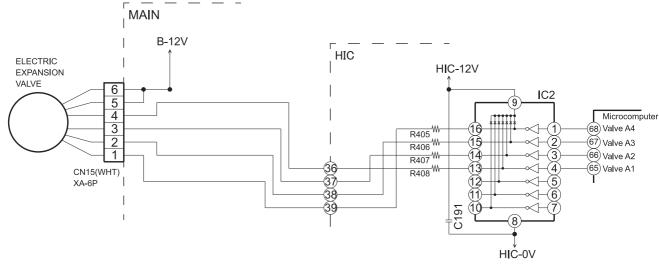

Fig.6-1

- The electric expansion valve is driven by DC12V, Power is supplied to 1 or 2 phases of 4-phase winding to switch magnetic pole of winding in order to control the opening degree.
- Relationship between power switching direction of phase and open/close direction is shown below. When power is supplied, voltages at pin (a) to (1) of CN15 are about 0.9V and 12V when no power is supplied. When power is reset, initial operation is performed for 10 or 20 seconds. During initial operation, meaure all voltages at pin (a) to (1) of CN15 by using a multimeter. If there is any pin with voltage that has not changed from 0.9V or 12V, expansion valve or microcomputer is broken.
- Fig.5-2 shows logic waveform when expansion valve is operating.

Table 6-1 **Drive Status CN15** Pin No. Wire 1 3 2 4 5 8 6 7 1 WHT ON ON OFF OFF OFF OFF **OFF** ON 2 **OFF** ON OFF **OFF** OFF **OFF** YEL ON ON 3 ON ON **OFF OFF** ORN OFF OFF OFF ON 4 OFF OFF BLU OFF OFF **OFF** ON ON ON **Operation Mode** $1 \rightarrow 2 \rightarrow 3 \rightarrow 4 \rightarrow 5 \rightarrow 6 \rightarrow 7 \rightarrow 8$ VALVE CLOSE $8 \rightarrow 7 \rightarrow 6 \rightarrow 5 \rightarrow 4 \rightarrow 3 \rightarrow 2 \rightarrow 1$ **VALVE OPEN**

Connector Pin No.

4 12V 0.9V

3 200ms

Fig. 6-2

With expansion valve control, opening degree is adjusted to stabilize target temperature by detecting compressor head temperature. The period of control is about once per 20 seconds and output a few pulse.

7. Outdoor DC Fan motor control circuit

• This model is built with DC Fan motor control circuit inside outdoor electrical unit.

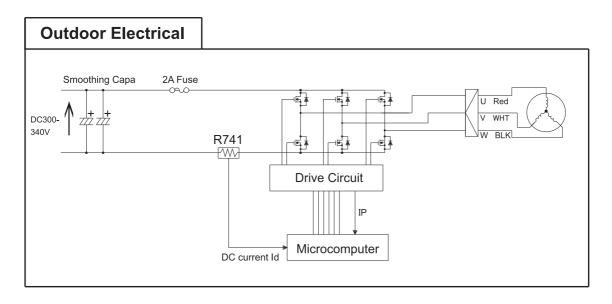

Fig 7-1

This DC Fan motor is control by outdoor microcomputer that follow the operating instruction received from indoor microcomputer. The DC current that flow from R741 will presume actual operation speed and control the rotation to follow the operating instruction. Based on this DC current it will detect a over current and other fan motor failure.

(1) Fan motor speed controller during starting

Due to the interference of strong wind etc., operation movement is changed based on fan direction and rotation speed as shown below during starting of operation.

In addition, the fair wind is define as wind that blow to outside direction using Mounth Ring part.

At strong and contrary wind . . . The rotational speed is not controlled as to protect the equipment and fan will rotate reversely depend on the wind. Automatically start when wind condition

become weak.

At contrary wind The rotational speed is controlled in fair wind direction after it slowly reduce the

speed and finally stop.

At fair wind ... The rotational speed is controlled as it is.

At strong fair wind ... The rotational speed is not controlled as to protect the equipment and fan will

rotate reversel depend on the wind. Automatically start when wind condition

become weak.

(2) Fan motor speed controller during unit operating.

There is a case where fan rpm is reducing during rotating caused by interference of strong wind if this condition continue in long period, fan will stop rotating. (LD301: 11 times blinking)

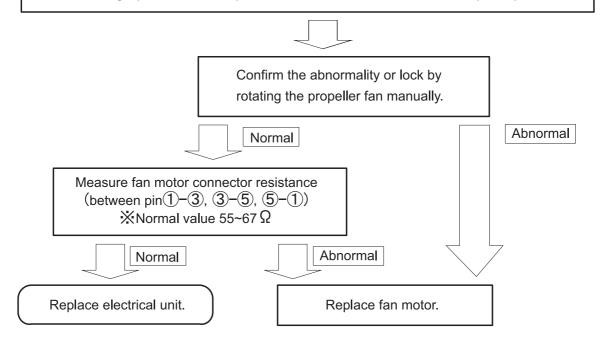

The unit will restart according to control as per during start (1).

(3) Method of confirming self diagnosis LD301 lamp: 12 times blinking

If the unit stop and LD301 on the pwb blinking 12 times [fan lock stop is detected], follow below steps to confirm it.

- 1. Fan lock stop is detected when something has disturb the fan rotation by inserting material into propeller fan or ice has growing inside outdoor unit caused by snow.
- 2. Confirmed that CN24 connector is securely inserted. Fan lock stop is detected also when connector is not properly inserted. Please securely insert if found any disconnection.
- Fan lock stop also can be detected where strong wind blown surrounding the unit.
 Please confirm after restart the unit. (It may take few minutes to operate the compressor).
 It is not a malfunction of electrical unit or fan motor if the unit run continuesly after restart the unit.
- 4. Check the motor condition as below prcedure.

Shut down supply and wait for 10 minutes for voltage to go down. Confirm it by measuring the DC voltage (must below 10V). Then disconnect fan motor connector (CN24).

- 5. Reconnect again fan motor connector (CN24).
 - ※ Please confirm above checking procedure if found 2A fuse blown. If fan motor is broken, replace both electrical unit and fan motor.

Caution

※ Beware of electrical shock due to high voltage when conducting and operation check. Power supply for DC fan motor and compressor is common (DC260-360V).

SERVICE CALL Q & A

COOLING MODE

The compressor has stopped suddenly during cooling operation.

Check if indoor heat exchanger is frosted.
Wait for 3-4 minutes until it is defrosted.

If the air conditioner operates in cooling mode when it is cold, the evaporator may get frosted.

DEHUMIDIFYING MODE

Sound of running water is heard from indoor unit during dehumidifying.

__\(\begin{array}{c} \A1 \)

Normal sound when refrigerant flows in pipe.

Compressor occasionally does not operate during dehumidifying.

Compressor may not operate when room temperature is 50°F (10°C) or less. It also stops when the humidity is preset humidity or less.

Q3) Cold air comes out during a dehumidifying operation.

A3)

To improve the dehumidification efficiency performs quiet fan operation. Therefore the air is cold and it is not a malfunction.

The operation does not stop even by setting the temperature higher than room temperature on the remote controller.

It sets to perform dehumidifying operation by setting the temperature slightly lower than remote controller setting.

HEATING MODE

Q1) The circulation stops occasionally during Heating

Mait for 5 -10 minutes until the condenser is defrosted.

The product begins with a weak wind during heating even though set to "HI" or "MEDIUM"

At the begining of heating, the fan speed will run at weak wind about 30 seconds, after that the wind will then increase to be required fan speed.

Heating operation stops while the temperature is preset at "30".

 $\begin{array}{c} \begin{array}{c} \begin{array}{c} \\ \\ \end{array} \end{array} \begin{array}{c} \begin{array}{c} \begin{array}{c} \\ \\ \end{array} \end{array} \begin{array}{c} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \end{array} \begin{array}{c} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \begin{array}{c} \\ \end{array} \\ \end{array} \begin{array}{c} \\ \end{array} \\ \end{array} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \\ \end{array} \begin{array}{c} \\ \end{array} \end{array} \begin{array}{c} \\ \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \end{array}$ \\ \\ \end{array} \begin{array}{c} \\ \end{array} \\ \end{array} \\ \end{array} \begin{array}{c} \\ \end{array} \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \\ \\ \end{array} \end{array} \begin{array}{c} \\ \end{array} \\ \end{array} \begin{array}{c} \\ \end{array} \\ \end{array} \\ \end{array} \\ \end{array} \begin{array}{c} \\ \\ \end{array} \end{array} \begin{array}{c} \\ \\ \end{array} \\ \end{array} \\ \end{array} \\ \end{array} \begin{array}{c} \\ \\ \end{array} \\ \\ \end{array} \\ \end{array} \begin{array}{c} \\ \\ \end{array} \\ \\ \end{array} \\ \\ \end{array} \\ \\ \end{array} \\ \\

If temperature is high in the outdoor, heating operation may stop to protect internal devices.

AUTO FRESH DEFROSTING Q1) After the ON/OFF button is pressed Auto Fresh Defrosting is carried out : to stop heating, the outdoor unit the system checks the outdoor heat exchanger is still working with the OPERATION and defrosts it as necessary before stopping lamp blinking. operation. **AUTO OPERATION** Q1 According to the room temperature heating How is the automatic operation or cooling operation is automatically selected. mode determined? Refer to the basic operation section. Can I set the room temperature at The room temperature setting can be set between 60°F (16°C) - 90°F (32°C). automatic operation. NICE TEMPERATURE RESERVATION When on-timer has been programmed, This is because "Nice temperature operation starts before the preset reservation"function is operating. This time has been reached. function start operation earlier so the preset temperature is reached at the preset time. Operation may start maximum 60 minutes before the preset time. It does not work. It works only during Does "Nice temperature reservation" cooling and heating. function operate during dehumidifying?

Even if the same time is preset,

the operation start time varies.

This is because "Nice temperature

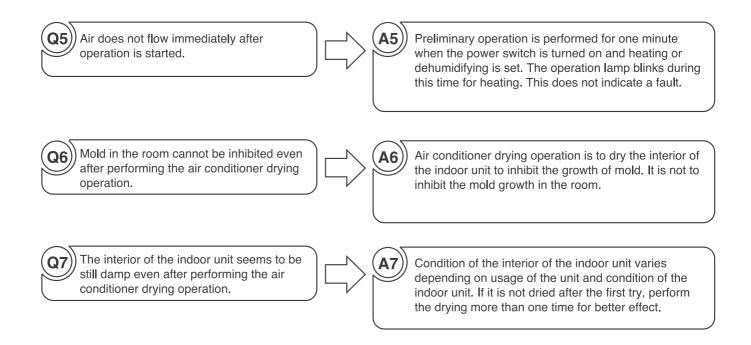

varies each day.

reservation"function is operating. The start

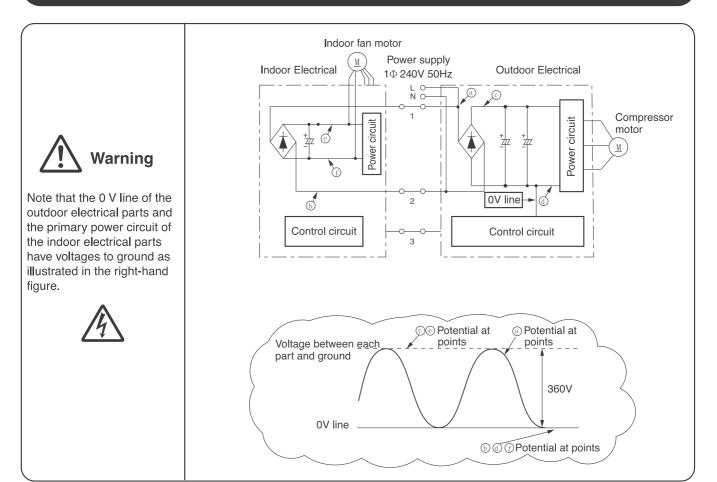

time varies according to the load of room. Since load varies greatly during heating,the operation start time is corrected, so it will

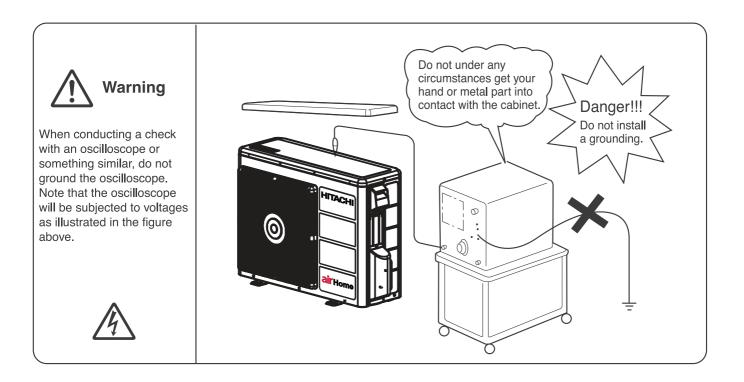

AT STARTING OPERATION

There may be a difference between the set temperature There is a difference between the set and room temperature because of construction of temperature and room temperature. room, air current, etc. Set the temperature at a comfortable level for the space.

Inspection instructions

DISCHARGE, PROCEDURE AND POWER SHUT OFF METHOD FOR POWER CIRCUIT.

WARNING

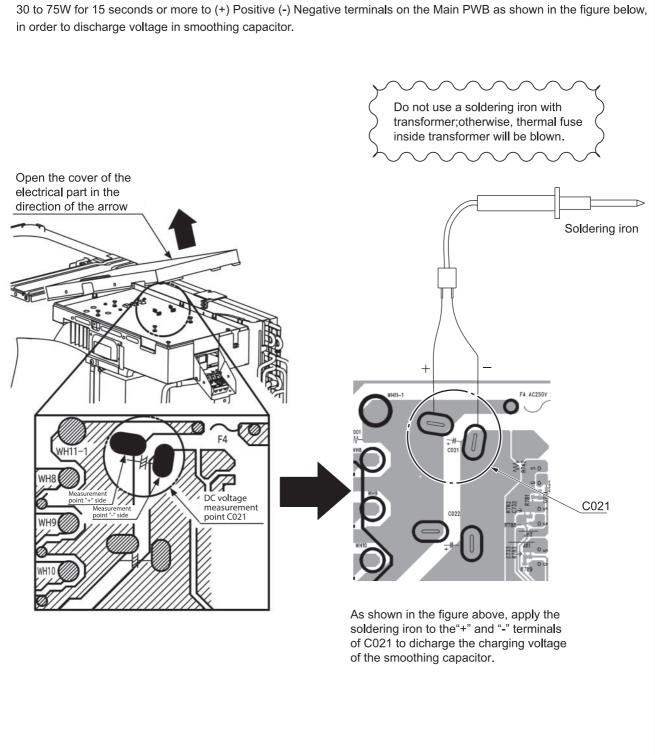

Caution

- Voltage of about 325V is charged between the terminal of smoothing capacitor.
- During continuity check for each circuit part of the outdoor unit, be sure to discharge the smoothing capacitors.

Discharge Procedure

- 1. Turn of the power.
- 2. After power turned OFF, wait for 10 minutes or more. Then, remove electrical parts cover and apply soldering iron of

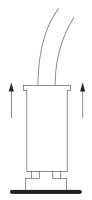

Other instructions

(1) Detaching and reattaching the receptacles for tab terminal.

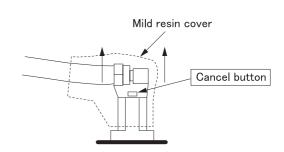

All the receptacles for connecting tab terminal are with a locking mechanism. Forcibly pulling any such receptacle without unlocking it will destroy it. Be on guard. When reconnecting it, insert it securely all the way home.

• Receptacle type and how to unlock them..

Vertical (with a resin case)

Hold the resin case and pull it out.

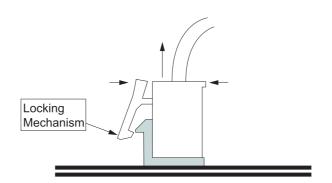

Horizontal (with a mild resin cover)
Hold the cancel button down on the
mild resin cover while pulling out.

(2) Detaching and reattaching the board connector.

The product comes equipped with many board connectors provided with lock mechanism. Forcibly pulling any such part without unlocking it will destroy it. Be on guard. When connecting it, insert it securely all the way home.

Pinch the locking mechanism with your fingers and pull it out unlocked.

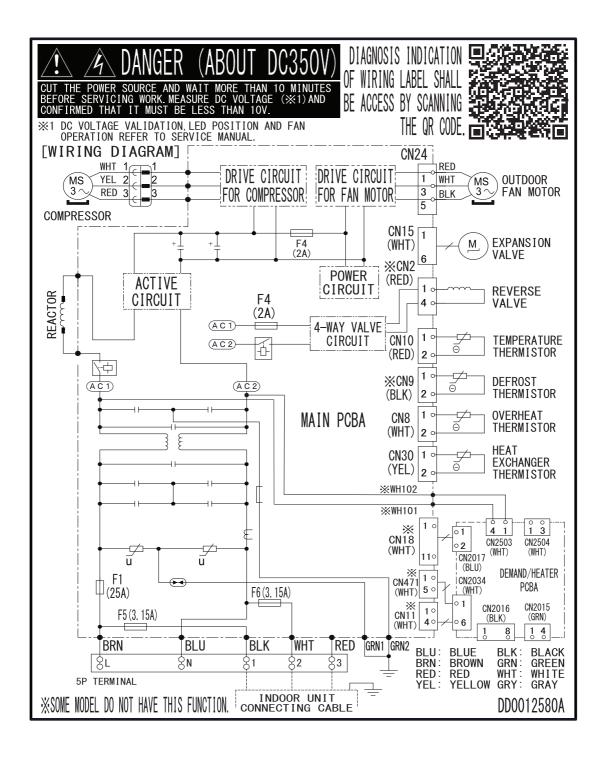

(3) Do not detach or reattach the connector while energized.

Do not under any circumstances detach or reattach the connectors while energized. That would destroy the board components and fan motor. For both the indoor and outdoor boards, ensure that the smoothing capacitor has discharged its electricity fully before you do your work.

Troubleshooting support

| No. | Function | Description | | |
|-----|------------------------------------|---|--|--|
| 1 | [Display on the outdoor unit side] | The failure mode detected on the outdoor unit side is displayed by blinking the "LD301". Detecting a failure will stop the outdoor unit and keep blinking the LD301 until it is restarted. (The communication error will persist until the communication is re-established). | | |
| 2 | Self-diagnosis memory | The failure modes detected on the indoor and outdoor unit sides are restored in the non volatile memory of the indoor unit can be read later on. (The memory will remain even after power-off). The failure modes detected on the outdoor unit side are written in memory every time any such mode occurs. The failure mode can therefore be detected on the indoor unit side without waiting for the retry frequency to reach the display of the indoor unit lamp. Moreover, the normal self-diagnosis display function which rarely occurs will store and display failure modes that do not end up displaying the indoor unit lamp. (Any such mode may be unable to be stored if indoor or outdoor communications is in a failure). The product stores 5 last-stored failure modes. There is a function for deleting memory. Once you clear the memory and run the product for several days, you can read the failure modes and check them, thereby detecting the less frequent failure phenomena. Failure modes can be checked by both blinking of the lamp of the indoor unit and the display of the remote control liquid crystal display. | | |

X The "self-diagnosis function of the communication circuit" available in our conventional models is now incorporated as part of the normal self-diagnosis function. In the case of a failure in the communication circuit, you do not have to conduct a special operation and operations can be automatically devided into 3 blinking operations and 12 blinking operations of the timer lamp. However, a strong external noise may have resulted in 12 times of blinking.

Checking the electrical parts of outdoor unit

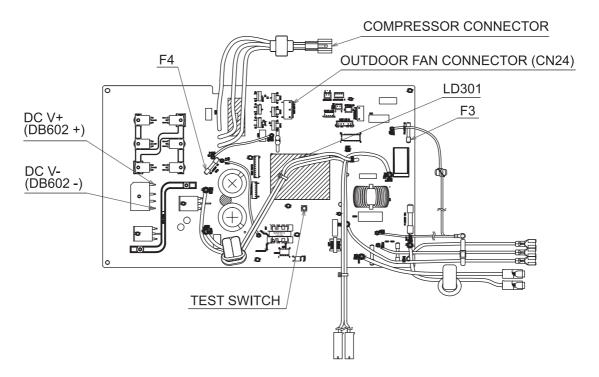

How to run the product with the outdoor unit test switch

If the indoor electrical parts is out of order and if you wish to run the outdoor unit.

- 1. Turn ON the outdoor terminal board L and N (220 240V).
- 2. Confirm that the "LD301" blinks once from the terminal side of the outdoor unit. Afterwards (when about 30 sec elapses after the power turns ON), confirm that the "LD301" changes to blinking 9 times (communication error).
- 3. When the "LD301" is blinks 9 times, if you press the test switch, the "LD301" lights up.

If you release your finger from the test switch within 1 sec to 4 sec after pressing the switch, the force cooling operation starts.

- * (If you press the test switch for 5 sec or longer, the self-diagnosis starts. In this case, turn the power OFF and starts teh procedure from 1 again.
- ※ (For the initialization of the expansion valve, it may take 1 min until the operation starts).
- 4. When you press the test switch again for 1 sec or longer, the unit stops the operation.

% Caution

- 1. Applying power directly to the outdoor unit will cause a rush current to stree the outdoor unit. Therefore, if the indoor unit is not out of order, do not use the method described in 3.
- 2. Before making the connection, be sure to turn off the breaker.
- 3. Do not under any circumstances run the product for more than 5 minutes.
- 4. Doing work with the compressor removed will cause the LD301 to blink 4 times. It will not to start.
- 5. For another test run, turn off the breaker and turn it back on. (The test switch is accepted only once after power-on. After operation by remote control, it is not accepted).
- 6. When the operation with the test switch is over, turn off the breaker and set the connectors back.

Self-check

If you cannot judge if it is an abnormality on the electrical part or the compressor by the "Blinking twice,3 times,

4 times or 5 times of the self-diagnosis indicator, perform the megger check to check the isolation of the compressor has no problems, perform the following [self-check].

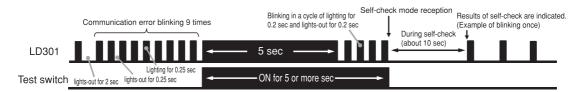

(The inverter should be checked).

How to make the self-check diagnosis

- 1. Turn the power OFF and wait for 10 min or longer.
- 2. Disconnect communication wire indoor outdoor (Terminal pin no.3).
- 3. Insert external service switch at CN18.
- 4. Turn ON power supply (wait until LD301 9 times blinking).
- 5. Press service switch 5 sec or longer until LD301 blink fast and then release the switch.
- 6. Self-check result will display by LD301 blinking times.

While the test switch has been pressed, the LD301 lights up and, if it is pressed for 5 sec or longer, the LD301 repeats a cycle of "Lighting for 0.2 sec and lights-out for 0.2 sec". When blinking starts, remove your finger from the test switch.

If you release your finger from the switch below 5 sec, the forced cooling operation starts.

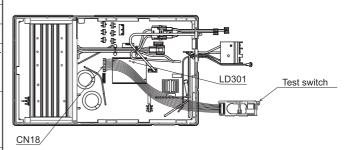

- 7. The result of self-check diagnosis are indicated. The contents of the result of diagnosis are shown in the table below.
- 8. The self-check complete.

Result of the self-check diagnosis

| SELF-CHECK DIAGNOSIS RESULTS | | | | | | |
|--|----------------------------|---|--|--|--|--|
| LD301 | Self-diagnosis description | Solution | | | | |
| Blink 1 time No problem with electrical parts. | | Replace compressor. | | | | |
| Blink 2 times Peak current cut signal. | | Replace electrical parts. | | | | |
| Blink 7 | NA-t | Compressor connector become disconnected. ⇒ Adjust connector. | | | | |
| times | Motor current error. | Compressor connector properly connected. ⇒ Check compressor,then replace electrical parts. | | | | |
| Blink 10 times | DC voltage error. | Abnormal AC input power supply (outside range of rated voltage ±10%). Connect to proper power supply. Normal AC input power supply (inside range of rated voltage ±10%). Replace electrical parts. | | | | |
| Blink 13 times | EEPROM read error. | Replace electrical parts. | | | | |

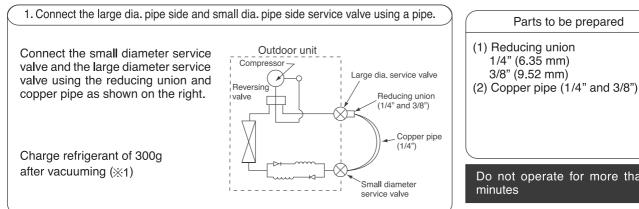

If the judgement result shows abnormality, check the connecting wire and, if it is not disconnected, replace the failed parts according to the correcting method.

Cautions

- 1. The self-check is effective only when the power is turned on for the first time. If the LD301 does not lights up, even if the test switch is pressed, turn the power off and wait for 10 min and start the procedure from beginning.
- 2. After the self-check mode is complete, it is not necessary to turn the power off (normal operation is restored). However, note that the self-check results continue blinking until the compressor start operating.

HOW TO OPERATE THE OUTDOOR UNIT INDEPENDENTLY

Do not operate for more than 5

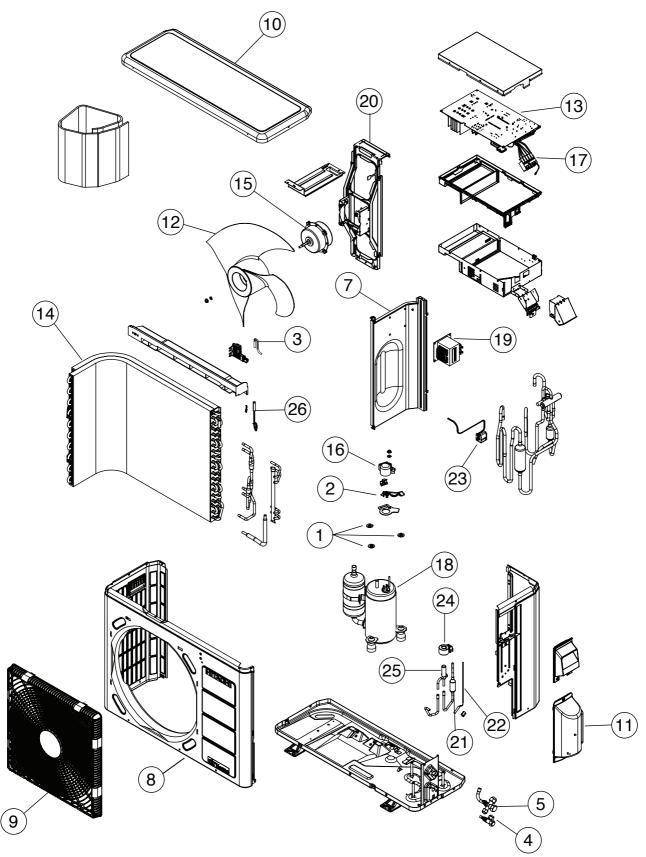

The operation method is the same as "How to operate using the connector to servicing the outdoor unit".

X1 The charging amount of 300g is equivalent to the load in normal operation.
